DETAILED ACTION

Response to Arguments

1. Applicant's arguments with respect to claims 1-6 have been considered but are moot in view of the new ground(s) of rejection.

2. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

3. Claims 1-6 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Regarding claims 1, 2, 5, and 6, recitation: "the largest amplitudes in delayed wave component sequences" is written unclearly since there's only one largest amplitude in component sequences.

Examiner suggests: "the largest amplitudes in each delayed wave component sequences".

4. Claim 2 recites the limitation "from the new combined impulse response sequence" on line 12. There is insufficient antecedent basis for this limitation in the claim.

5. Claim 2 recites the limitation "the timing signal output from said estimation region detector" on line 18. There is insufficient antecedent basis for this limitation in the claim.

Claim Rejections - 35 USC § 102

6. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

7. Claims 1 and 6 are rejected under 35 U.S.C. 102(b) as being anticipated by Okanou (US 5,127,025).

a) Regarding claim 1, Okanou discloses a delayed decision feedback sequence estimation diversity receiver comprising:

means for extracting a plurality of reception signals by using a plurality of antennas (10a and 10b in Fig. 1) when estimating a transmission signal from reception signals having undergone transmission path distortion;

means for combining impulse response sequences in transmission paths while canceling delayed wave components having the largest amplitudes in delayed wave component sequences in impulse response sequences in the respective transmission paths (15a, 15b, 16a, 16b, 17a, 17b, 20 in Fig. 1; Col 3, L 7-32); and

means for performing signal estimation on the basis of a new impulse response sequence generated by combining the impulse response sequences (23 in Fig. 1).

b) Regarding claim 6, Okanou discloses a delayed decision feedback sequence estimation method comprising:
